

Highlighting New Technology

John Donnelly, JPT Editor, jdonnelly@spe.org

The *Journal of Petroleum Technology (JPT)* is soliciting information on new and emerging technologies to publish and inform the upstream oil and gas community of their potential. Companies and individuals are invited to submit information on their new technologies for possible publication, both in the *JPT* print edition and online, by submitting an article describing the technology and what it can do.

[This template](#) outlines the minimum content necessary for inclusion. Developers of technology will need to define the reason or need for the technology, outline its purpose, describe how it works, state its target applications, and note how and where it has been used. In addition, the submission must provide information on any case studies, discuss what would cause the new technology to not work or fail, and describe the possible health, safety, and environmental impact.

The technology must provide significant benefits beyond commonly used technologies. It must also be original and, to a certain degree, groundbreaking. Future plans for the technology and whether it has been commercially developed should be given, and a company website and contact information provided. The information should avoid undue commercialism, product cost information, and the use of trademark or other commercial symbols. The technology must be no more than two years old, meaning less than two years since its full commercial deployment or introduction to the marketplace. Companies are not limited to one submission. The submissions will be reviewed by SPE's technical directors for possible inclusion in *JPT*.

If you are interested in publishing information on your new technology, please submit an article that follows the defined criteria to *JPT* Editor John Donnelly at jdonnelly@spe.org.
